Epigenetics: DNA methylation

Epigenetic Machinery of *Reticulitermes*

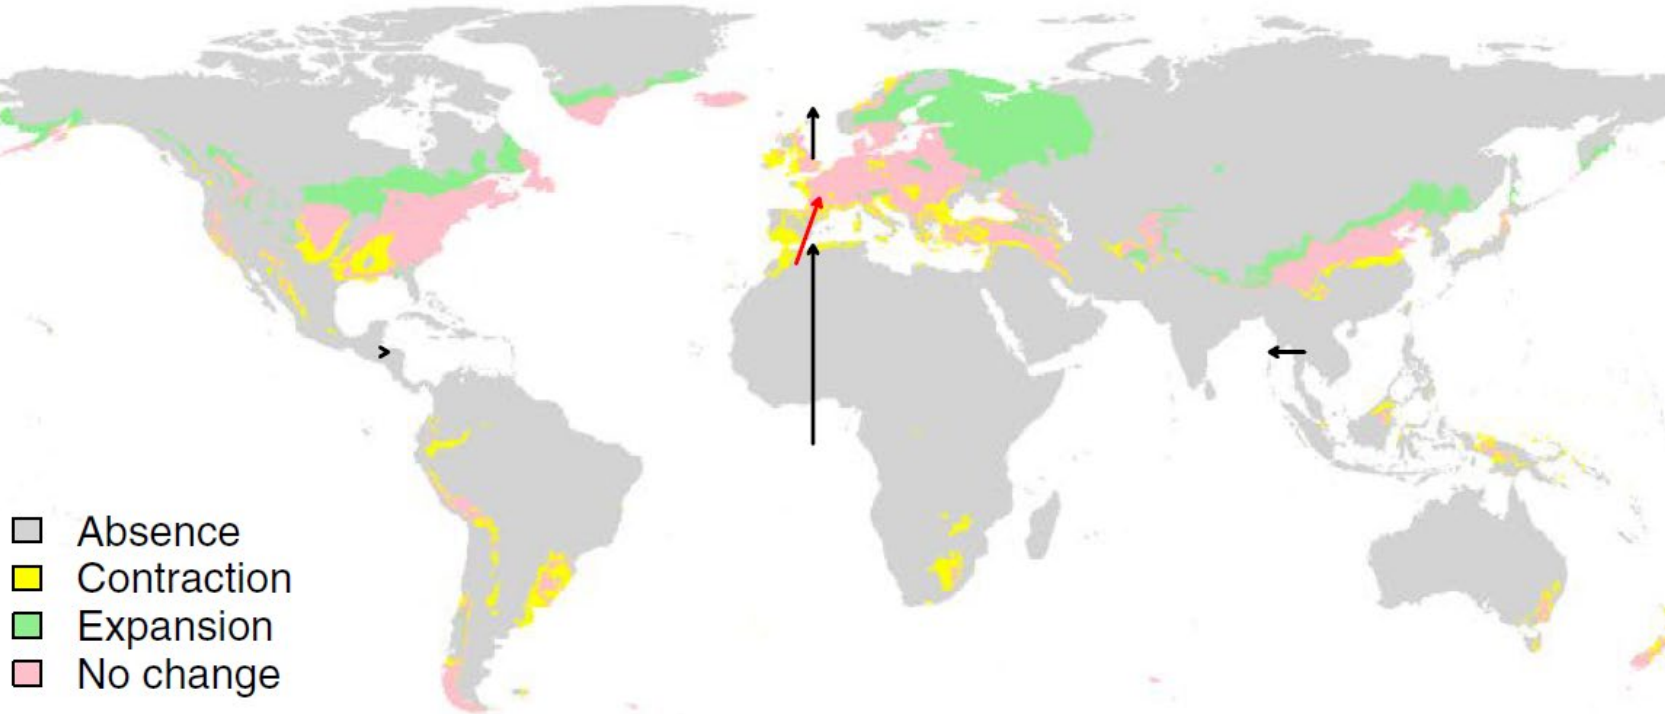

R. flavipes is a pest in N. America and invasive elsewhere in the world

Could DNA methylation have something to do with this?

Questions

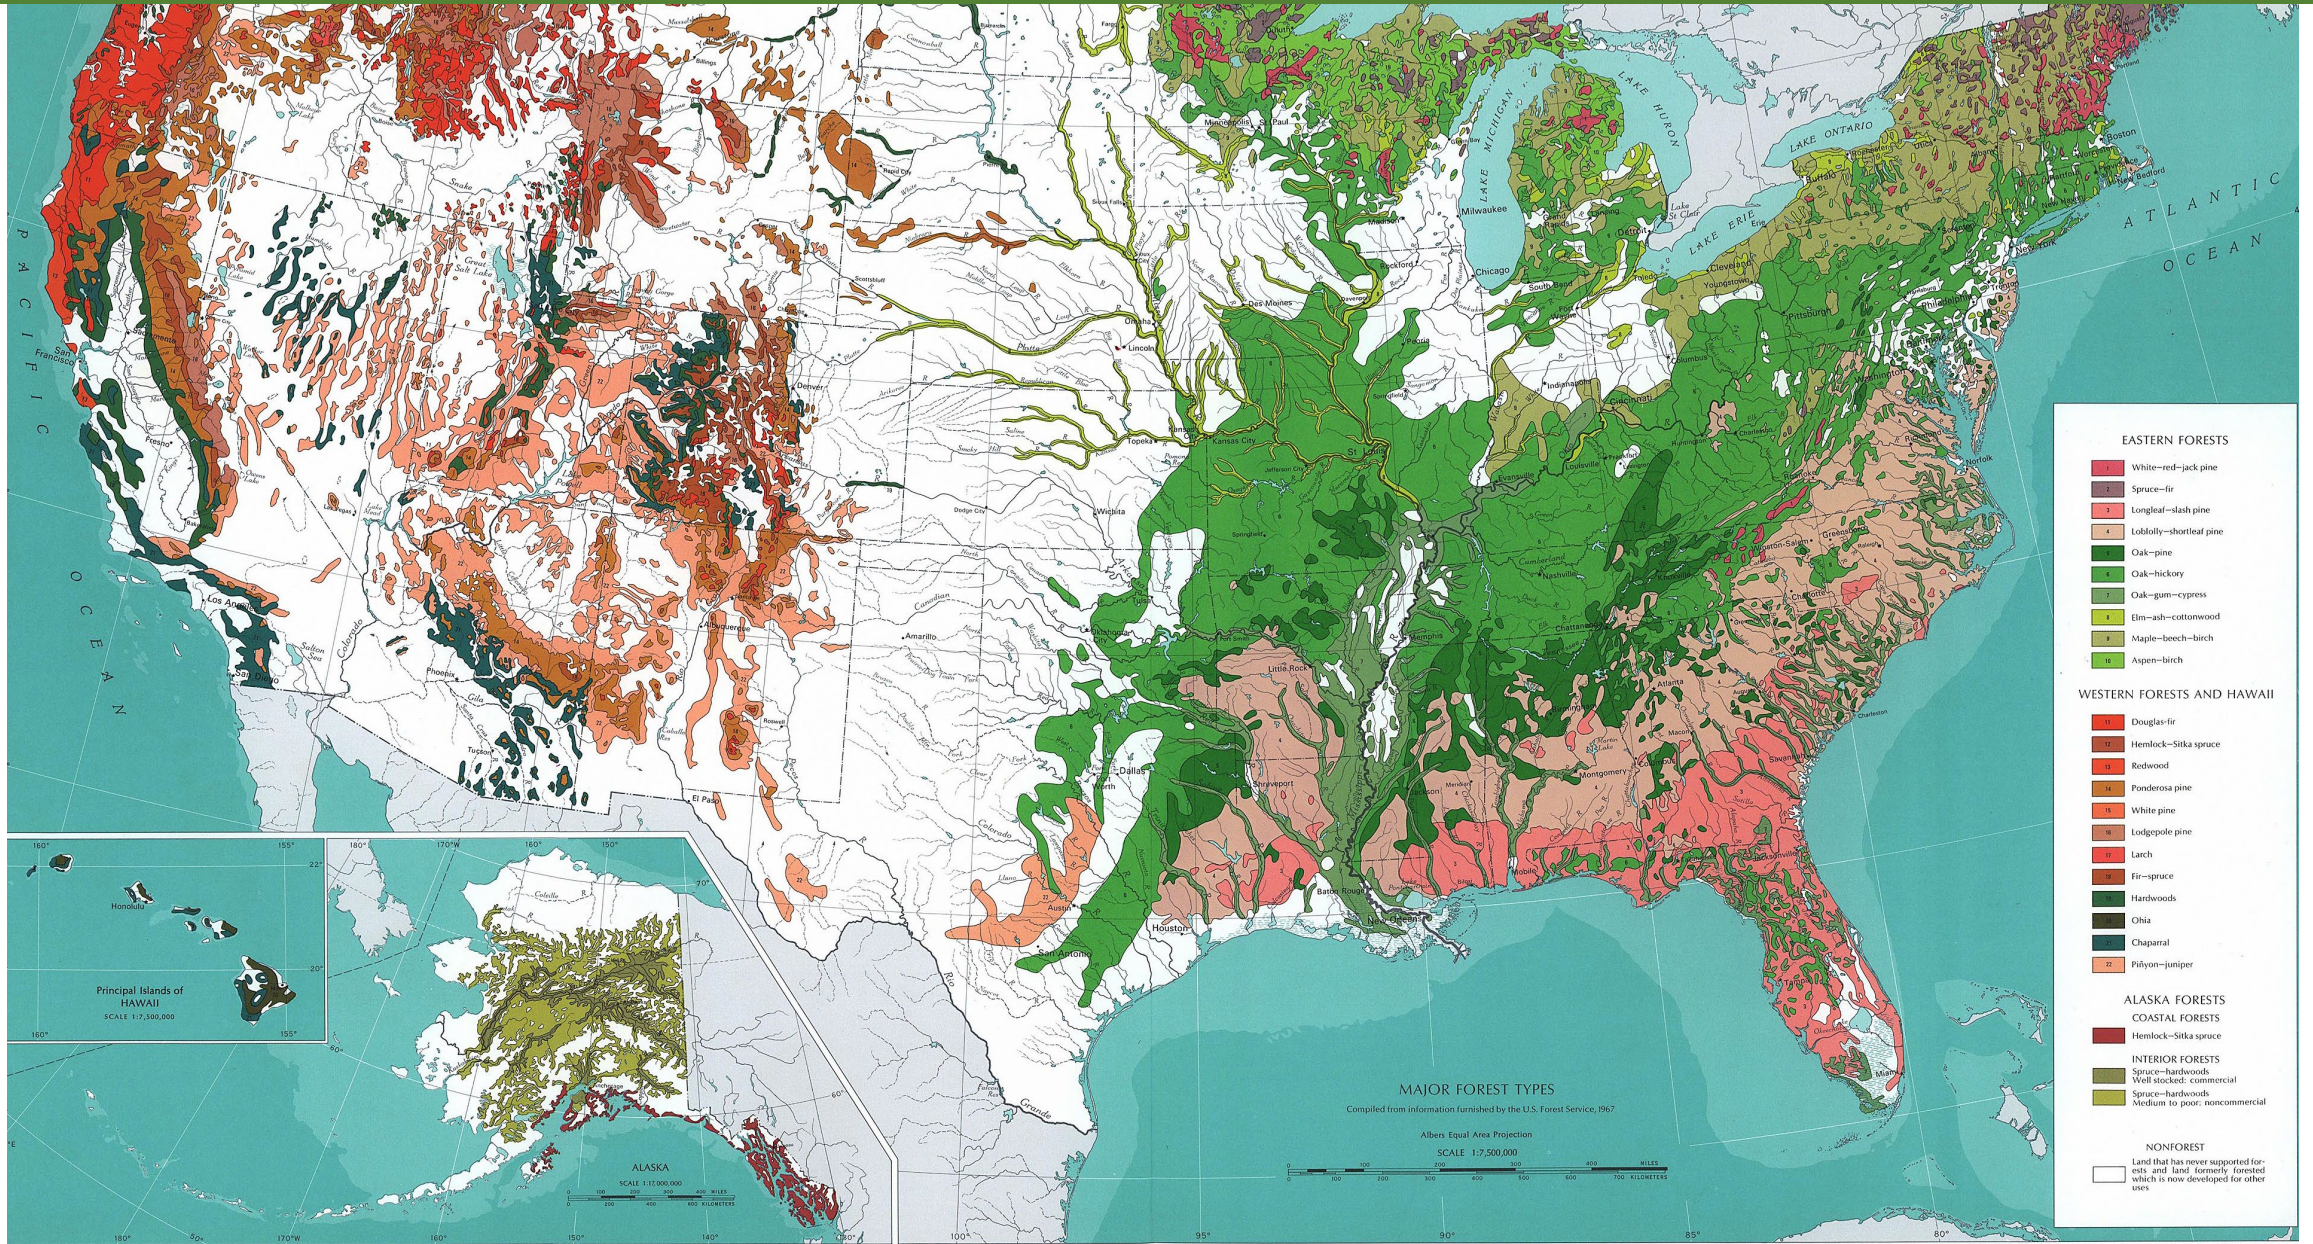

- **Disturbance of forest ecosystems**

1. Are there long-term methylation differences in *R. flavipes*?

2. Did ecological disturbance lead to (short-term) changes in DNA methylation?

Appalachian Forest Ecosystems

Pine? Oak?

Environmental Predictors:

DP = Dry-season Precipitation

ST = Summer Temperature

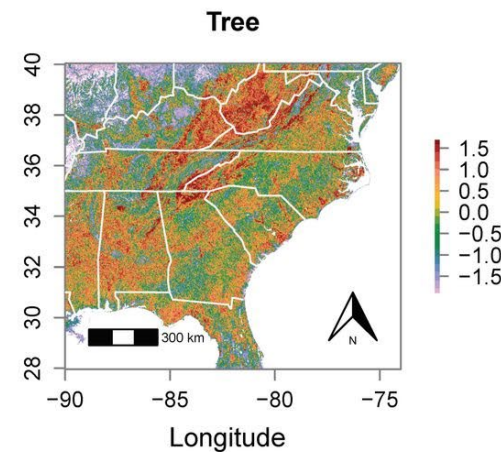

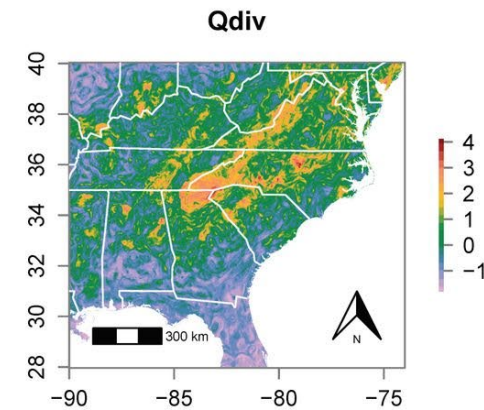

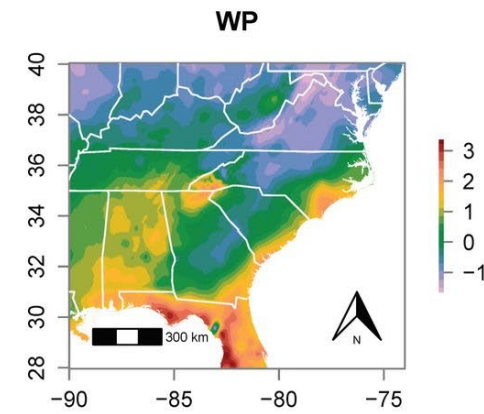

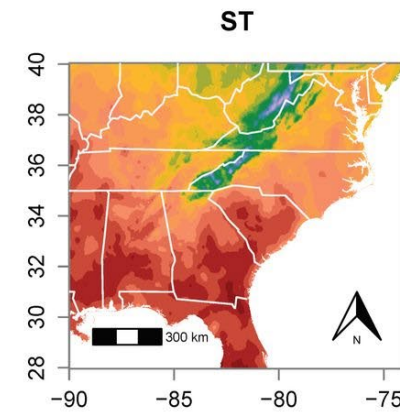

WP = Wet-season Precipitation

AWC30cm = Available Water Capacity at a Soil Depth of 30 cm

Pdiv = *Pinus* (pine) species richness

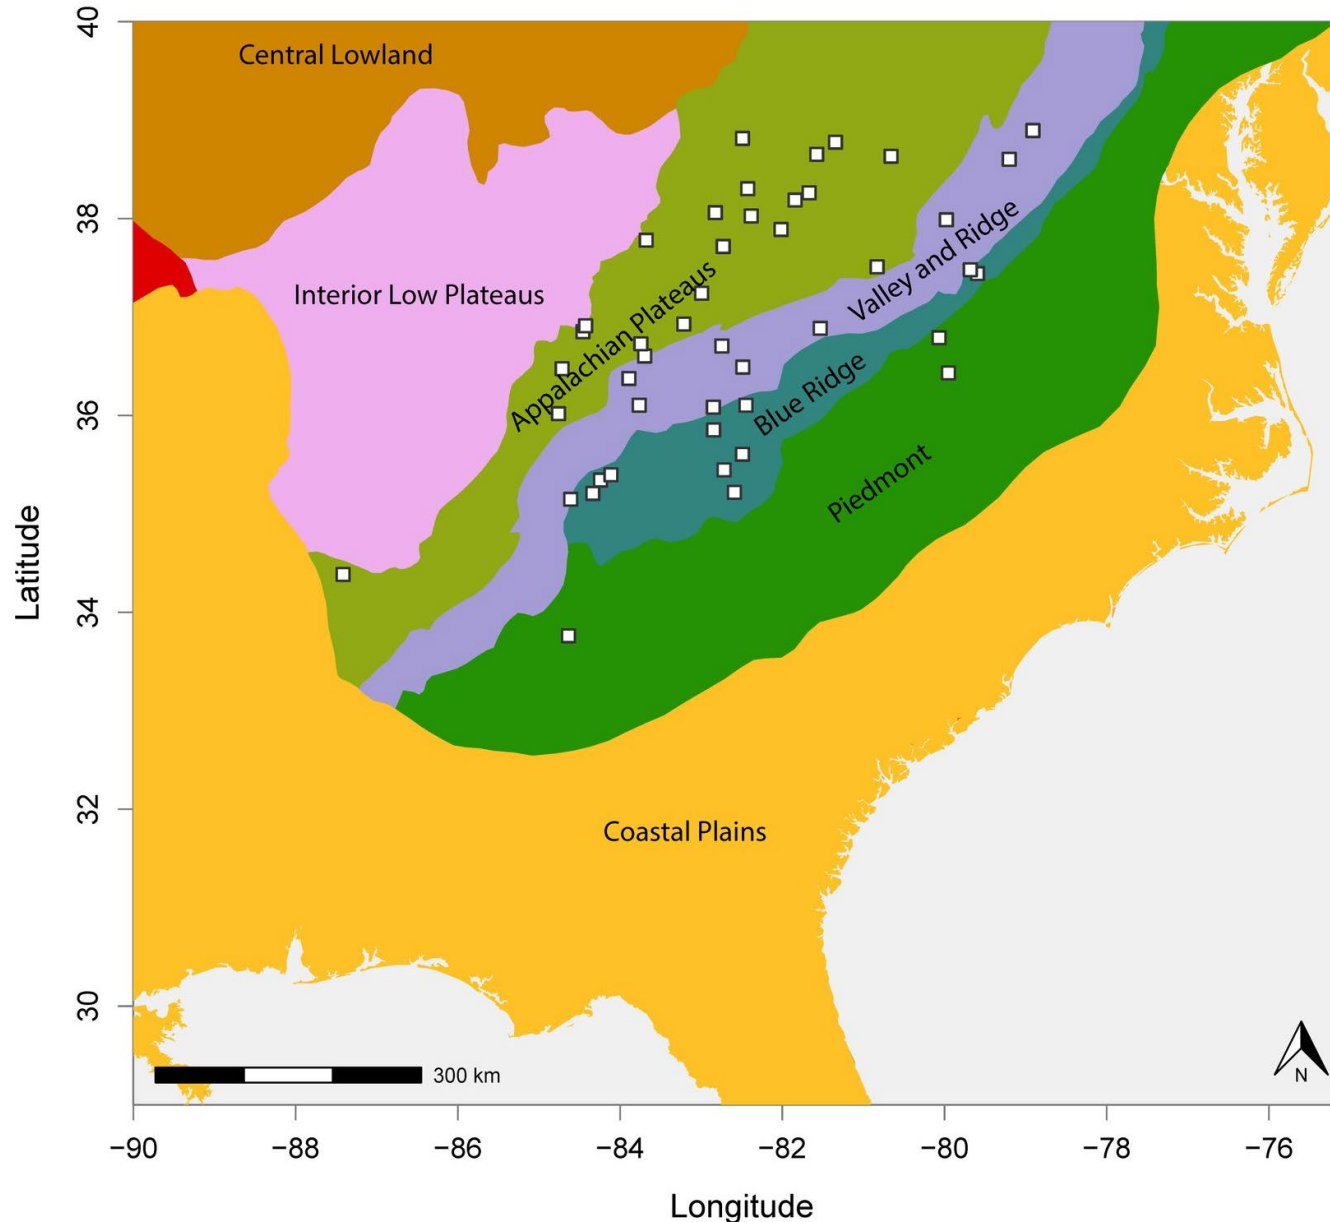

Qdiv = *Quercus* (oak) species richness

Tree = tree canopy cover

Epigenetic Data Collection:

Four Ecoregions: Appalachian Plateaus, Valley and Ridge, Blue Ridge, Piedmont

DNA methylation assessed using

methylation-sensitive
Amplified Fragment
Length Polymorphism
(msAFLP)

Tree Canopy Cover: Higher canopy cover = less methylation at locus AT104

Tree Canopy Cover: Lower canopy cover = more “mixed” colonies

Tree Canopy Cover: “Mixed” colonies

Conclusions

- 1 Long-term methylation differences were detected
- 2 Canopy cover affects short-term methylation differences
- 3 Canopy cover affects epigenetic colony mixing
